Cloud Backup Storage and Restore Service

US Department of Homeland Security has recommended reviewing backup plans immediately and backing up data/servers daily, specifically on backup devices that get disconnected from the network every day, or even off-site backup.

Ransomware attacks continue to evolve and its concept reaches a high level of maturity now. Ransomware is the product generating substantial revenue from victims worldwide. You don't have to be part of the statistics. CSI Cloud Backup Storage and Restore service will backup the database and server to the cloud of your choice on a daily basis. In this manner, CSI can quickly help agencies recover InfoShare in the event of an attack.

Automatic Data and Server Protection with Cloud Storage

Flexible Backup

Schedule your backup without any input and upload specific files or folders

Smart Protection

Protect modified files and go back to previous versions with ease

Security and Privacy

Store files with Federal Government certificated cloud storage

Disaster Recovery

Restore anything from a single file to an entire server, from which date

Exceptional Ease of Implement

No IT Pro required, no learning curve

Ransomware continues its rampage across the world

- 2005 – First modern ransomware started with Trojan.Gpccoder
- 2015 – Over 4 million ransomware samples
Ransomware as a service appears (RaaS)
- 2016 – Hospital pays \$17k in ransom
Ransomware revenue surpasses \$1 billion
- 2017 – Ransomware volumes increased by 350%
WannaCry and Petya variant appears, impacting 150 nations globally
- 2018 – Ransomware volume reaches 206.4 million attacks
SamSam ransom payments - Total: \$6.5 million USD
- 2019 – McAfee reports ransomware attacks have increased 118% just this year.
In August, 22 cities in Texas were hit with ransomware, affecting both small and large agencies.
4 InfoShare agencies have been attacked with ransomware. Their InfoShare applications were unavailable for weeks.

How does ransomware affect your business?

- > Cybercriminals develop new way to **by pass antivirus programs**
- > **Encrypts files and database**, and paralyze agency's ability to access the critical information
- > Enumerate all accessible drives, such as local file-share servers, and encrypt entire hard drives, along with **all of the incremental backups**
- > **Demand a substantial ransom**

You have three choices

- > Pay the ransom and hope for the affected data to be decrypt (in many cases does not happen)
- > Wiping the systems and re-installing from scratch
- > **Restoring data from clean backups** - a good backup policy with both local and off-site backups, as with **InfoShare™ Cloud Backup Storage and Restore Service**

Public agencies who want to protect their agency's information and avoid paying tens of thousands of dollars in ransom should consider implementing cloud backup and restore services.

Why InfoShare™ Cloud Backup Storage and Restore Service?

Digitize the real-time data and store the sensitive files

CJIS standard technology – Microsoft Azure Government Cloud or Amazon AWS GovCloud

Isolated from your local computers, completely disconnected to your network, and hence protected from infection

Automatic backup to streamline IT tasks

Flexibility on determine which files to restore, from which date
