

FIRE & EMS

INTEGRATED FIRE & EMS SOLUTIONS IN A SINGLE PLATFORM

Designed to be the most integrated all-in-one application suite on the market, our NFIRS 5.0 compliant system supports all phases of Fire and EMS management from the initial call to the validation and submission of the final report. Information flows seamlessly from dispatchers to responders to departments to investigators and command staff. Moreover, our Fire & EMS solution streamlines inspection processes and permit management.

HIGHLIGHTS

- Automatic NFIRS validation and report submission to the State
- Store all incident information in a single Master location
- Extend system functionality with powerful modules
- Total vertical integration between CAD, MDT, and RMS
- Streamline fire inspections to maintain up-to-date premise records

CAPABILITIES

TOTAL SOLUTION

CSI solutions are powered by the InfoShare® Engine, a low-code development platform for government ERP applications designed to be adaptable and scalable (single, regional, or multi-jurisdictional). All applications are unified under a single system and come equipped with specialized functionality to meet the demands of today's public sector agencies.

DATA MIGRATION

We offer the most comprehensive, structured data conversion services on the market. NFIRS and non-NFIRS data is converted to our native RMS data whereby the original data is not simply copied, but also cleansed, condensed, and standardized. No re-entering old data, no accessing old systems, no removing duplicate entries.

MULTI-AGENCY COVERAGE

A regional approach with a local feel. Each agency participating in a regional RMS has access to shared resources but retains control of its own data and its own identity—logos, report formats, protocols, approval process, workflow, and so on. Moreover, each agency can choose to deploy specific modules on a need/affordability basis.

CLOUD COMPATIBILITY

InfoShare® Cloud supports public, private, or hybrid cloud requirements, hosted on the CJIS-compliant AWS GovCloud or Azure Government—both designed for maximum government security. With cloud-deployable applications, agencies are protected from advanced cyber attacks and benefit from robustness against unexpected disasters.

PLATFORM INDEPENDENCE

Modern, web-based technology allows any device with an internet connection—desktop, MDT, tablet, smartphone—to access InfoShare® RMS. No compatibility issues, no hardware restrictions, no software maintenance. The system also supports an offline mode, automatically syncing data when the connection is restored.

Integrated all-in-one CAD, RMS, and MDT solution for Fire and EMS departments

FIRE & EMS CAD

Support dispatchers in processing incident information and allocating resources efficiently with the dispatcher assistance system. Agencies can configure the system to fulfill their specific needs including setting built-in pre-plans and response plans.

- Pre-plan assignment for auto-dispatching
- Dispatcher assistance system (Fire/EMS alarm, response plan, run card)
- Color-coded unit and apparatus dispatching
- Dynamic, GPS-based unit recommendation
- Real-time unit location tracking (AVL/ARL)
- Master Location index (flags, floor plans, HazMat, prior incidents)

FIRE & EMS MDT

All mission-critical information pertaining to the CFS is shared with responders in real-time from the Master Location database. Firefighters and EMS personnel arrive on the scene better prepared with enhanced situational awareness.

- Unit monitoring and tracking
- Flexible event escalation (add units, raise alarm level)
- Integrated mapping with detailed information (hydrant, driveway, obstruction)
- Status monitoring (timer, log, incident history)
- Color-coded static display boards
- Real-time location information (flags, floor plans, photos, HazMat, recent CFS)

FIRE & EMS RECORDS MANAGEMENT

Support all aspects of records management including data collection, storage, investigation, reporting, as well as department activities such as scheduling-rostering, personnel, training/certifications, permits, inspections, apparatus, inventory, hydrants, and more.

- Bi-directional CAD, RMS, and MDT integration
- Automatic NFIRS code mapping
- Incident intake via CAD or RMS
- Apparatus, asset, inventory, and hydrant management
- Occupancy, permit, and inspection management
- Fire & Arson Investigation Reports

NFIRS & ePCR REPORTING

Paperless reporting and approval with digital signatures, followed by case disposition. Event details are pre-populated in NFIRS and ePCR reports, eliminating duplicate data entry and errors. Reports are physically stored in the system for efficient archiving and viewing.

- NFIRS with validation and error reporting
- Field validation checks (mandatory fields, data type, format, range)
- Auto-route reports for approval
- Narrative and multimedia attachment functions
- User-definable fields and labels

ACTIVE RESPONSE APP

Designed to help both professional firefighters and volunteer firefighters to communicate effectively. Users receive real-time notifications, status updates, and instructions on compatible mobile devices to actively respond to emergent scenarios.

- iOS/Android device compatibility
- Bi-directional CAD integration
- Notifications and alerts
- CFS notice and information
- Member status and list display
- Unit recall and status assignment

FIRE INSPECTION WITH PORTAL

Streamline inspections, create customizable worksheets/checklists, and manage permits within an integrated environment involving fire inspection, records management, smartphone app, and portal. Comprehensive billing and invoicing services for inspections and permits.

- Inspection assignment, scheduling, and recording
- User-defined fire inspection checklist/worksheet
- Statistical Report (summary, year-end, invoice status, receipt ledger)
- Occupancy and hydrant inspections
- Billing and invoicing services
- Web-based fire inspection portal

CLOUD INTEGRATION

InfoShare® Cloud brings multiple cloud environments together to create scalable, reliable, and low-cost applications operating as a single, cohesive IT infrastructure. Our integration supports public, private, and hybrid cloud requirements hosted on the CJIS-compliant AWS GovCloud or Azure Government—both designed for maximum government security. Traditional application integration is complex, expensive, and not to mention, resource-intensive. They typically lack flexibility and have limited storage.

CSI's cloud integration with robust security authentication and permission policies yields many advantages including scalability, unlimited storage, improved performance, enhanced user experience, and substantial cost savings in maintenance and deployment.

EXTENDING FIRE & EMS

Personnel and Scheduling

Support all aspects of personnel management such as training, time off, overtime, document tracking, and scheduling.

Policy and Procedure

Promote compliance and understanding of organizational policies.

Fire Arson Investigation

Manage case data, documents, and evidence for fire and arson investigations in compliance with NFPA 921 standards.

Rapid SOS Interface

Access contextual data from information systems such as smartphones, wearable devices, smart buildings, etc. in emergencies.

Fire Inspection Billing Module

Maintain accounting and invoice/billing services for permits or inspections in the Fire Inspection Application.

NFIRS

Streamlined NFIRS reporting with automatic code mapping, pre-populated data, auto-validation, and easy review.

GIS (ESRI ArcGIS/WTH)

Interface with GIS providers to maintain map layers, create geofiles, enable mobile navigation, and add real-time traffic mapping.

Other CAD & RMS Systems

NIEM-compliant integration with other vendors' CAD and RMS systems to promote seamless data exchange.

CSI designs robust, fully integrated, and configurable software to revolutionize state, county, and local government operations.
